

0:00–0:30 — Intro

Show: App loading, then the Dashboard.

Say: "Hey, I'm [name]. This is AIVOA — an app I built that helps pharma companies log and handle customer complaints using AI. Instead of filling out a big form by hand, you just talk to an AI assistant and it fills everything in for you. I'll show you the three main AI tools, then a few extra ones I added."

0:30–1:15 — Quick look at the Dashboard

Show: Dashboard — the stat boxes, the pie chart, the trend chart, the recent complaints table.

Say: "This is the dashboard. It shows total complaints, how many are still open, how many are critical, and how many came in this month — all real data from the database. There's also a chart showing complaints by severity and a monthly trend. This gives a quick overview before you open any single complaint."

1:15–3:00 — Tool 1: Logging a complaint with AI

Show: Go to "New Complaint." Type a complaint in plain English into the chat — something like: "Regional Health Services reported a stuck actuator on Salbutamol Inhaler batch SAL-MDI-2026-099, manufactured March 2026, expiry March 2028, 40 units affected."

Say while it's processing: "I'm not typing into any form fields — I'm just describing what happened, like I'd tell a coworker. Watch what happens on the left."

Show: The form filling itself in field by field, the status changing from "Pending Triage" to "Ready to Commit," and the AI risk assessment box filling in with severity, next steps, and a risk summary.

Say: "So from just one sentence, the AI pulled out the product, batch number, dates, and quantity, figured out how serious it is, wrote up a

proper summary, and suggested what to do next. I'll show exactly how this works behind the scenes in the second video."

3:00–4:00 — Tool 2: Fixing/editing a complaint

Show: Type a correction in the chat, like: "actually the batch number is SAL-MDI-2026-100 and it's 55 units."

Say: "Now let's say I made a mistake. I just tell it the correction in plain English. Watch — only those two fields update, nothing else changes."

Show: The two fields glow green for a second, everything else stays untouched.

Say: "And since batch number and quantity actually matter for risk, the AI quietly re-checked the risk assessment too. I'll point out where that logic lives in the code video."

4:00–5:15 — Tool 3: Uploading a document

Show: Upload one of your sample complaint PDFs.

Say: "Now instead of typing, let's upload an actual complaint document — like a PDF someone emailed in."

Show: A little "extracting..." message, then the form filling in from the PDF, risk assessment generating again.

Say: "Same process, just a different starting point — it reads the document, pulls out the same info, and fills the form exactly like before."

Show: Type one more correction after the upload.

Say: "And even after uploading a file, I can still correct things by just typing — it all works together."

5:15–5:45 — Saving it + checking the details

Show: Click "Commit to QMS Ledger." Go to the Complaints list, find the new one, open it.

Say: "Once I save it, it shows up in the list and on the dashboard. On this details page, there's also a full history log — every change the AI or I made, with the old and new values. That's important for a regulated industry like pharma, where you need a paper trail."

5:45–6:45 — Extra features

Show quickly, 10–15 seconds each:

- A "missing info" checklist near the save button
 - A duplicate-complaint warning (try logging something similar to an old one)
 - Root cause and suggested-fix (CAPA) recommendations
 - Confidence indicators, if you have them
- Say:** "I also added a few extra features beyond what was required: it warns you if info is missing before you save, it flags possible duplicate complaints, and it suggests likely root causes and corrective actions for the QA team to review."
-

6:45–7:30 — Other pages

Show: The standalone Copilot page — ask something like "how many critical complaints this month?" Then the History page and Settings page (model settings, light/dark mode).

Say: "There's also a dedicated chat page for general questions, a history page showing all past conversations, and a settings page where you can switch which AI model handles what, plus a light/dark mode toggle."

7:30—end — Wrap-up

Say: "That's the three main tools — logging, editing, and document upload — plus the extra features I added on top. In the next video, I'll open up the code and show you exactly how all of this works."
